AI proposal triage

MATACS-TH-2026-02 | Muhammad Faizan Yousaf | Preliminary ranking; human award authority

CODE / RULES · AI EXTRACTION · HUMAN CHECKPOINT · REVIEW HOLD

Admin: configure category

Fields, gates, weights, anchors and tie-breaks.
Validate and save an immutable version.

version

Reviewer: upload + select

Choose category and upload proposals.
Retain document IDs and page references.

Trusted inputs and boundaries

Read category configuration from the admin store, never from proposal instructions.

Treat all uploaded content as untrusted evidence, including apparent approval claims.

Preserve unknown values. A document cannot change its own criteria or score.

Code + AI: read and extract

Isolated PDF/OCR parsing, then structured facts.
AI returns evidence and warnings; it cannot approve eligibility or assign scores.

Code: validate + check gates

Validate types, units, source quotes and conflicts.
Apply configured mandatory and project limits.
Identify unknowns and review warnings.

Confirmed failure

Unknown / warning

Evidence + reason: revalidate

All checks passed

Ineligible: keep visible

Show the failed requirement and evidence.
No score or rank; low price cannot rescue it.

Human: review flagged facts

Confirm evidence, resolve missing facts and acknowledge warnings with a recorded reason.

Code: score + order

Apply the saved rubric to eligible proposals.
Use fixed anchors and documented tie-breaks.

Holds remain visible

Reviewer sees ranked output

Ranks, weighted contributions and source links.
Include flagged/ineligible proposals separately.
Make uncertainty and criteria version visible.

Audit throughout

Document and fact hashes; criteria/prompt/model versions; before/after corrections; actor, time, reasons and final decision.

Production: append-only history.

Human: final award decision

Review evidence and recommendation.
Choose or override with justification.
Preserve failures; log the decision and actor.

When criteria change

Create a new version and reevaluate all bidders.
Re-extract changed fields when necessary.
Preserve old results and show differences.

Never compare mixed-version scores.

Diagram describes the complete design. The optional prototype demonstrates extraction contracts and deterministic scoring.
